$\rho = 0.5$: interventions remove the overshoot
full training
freeze shared u at crossing
project out motion of c_1
$(c_1 - s_1)/s_1$ (%)
time since c_1 reaches s_1
Pinning c_1 barely moves the loss
$\mathcal{L}$
time since c_1 reaches s_1
Freezing u costs loss; pinning c_1 does not
freeze shared u at crossing
project out motion of c_1
extra $\int \mathcal{L}\, dt$ after crossing (%)
