Step size, $\rho = 0.5$: control crosses only past $\eta \approx 1/3$
$\eta K(s_1) = 1$
shared u
unshared control
c_1 overshoot (%)
GD step size η
Random init, exact flow: signal is sharing-specific at small σ
shared, $\rho = 0.2$
shared, $\rho = 0.5$
shared, $\rho = 0.8$
unshared, all ρ
c_1 overshoot (%), median and IQR
random dense init scale σ
Finite data, $\rho = 0.5$: scatters the signal without faking it
population, same init
shared u
unshared control
c_1 overshoot (%), median and IQR
sample size N, full-batch GD
SGD, $\rho = 0.5$, $\eta = 0.005$: jitter is small against the signal
shared u, raw
shared u, 1-time-unit mean
unshared control, raw
unshared control, 1-time-unit mean
c_1 overshoot (%), median and IQR
minibatch size, fresh samples
